

OUR SUSTAINABILITY PRIORITIES

BETTER DESIGN, MATERIALS AND MANUFACTURING FOR A MORE CIRCULAR FUTURE.

RollsPack is a signatory to the Australian Packaging Covenant Organisation. We support APCO's focus on improving packaging design, increasing recycled content and strengthening resource recovery.

OUR APPROACH

Sustainability Statement

At RollsPack, we work with customers to develop packaging that protects their products and supports their sustainability goals. These goals may include reducing plastic waste, using more recycled material or lowering the carbon footprint of their packaging.

► Designing for recycling

We develop packaging with recycling after use in mind. Where suitable, we choose simpler material structures and review components that can make recycling difficult. We consider the collection and recycling options available where the packaging will be used.

► Reducing material use

We look for opportunities to reduce material use by reviewing pack size, film thickness and packaging design. Any reduction needs to maintain the strength and protection required to keep the product safe during packaging, transport and use.

► Using recycled materials

We consider recycled content where it is suitable, including in mailers and satchels. For food packaging, we assess its suitability in the structure or outer layers, taking account of food safety, product protection and performance requirements.

► Maintaining performance

Sustainable packaging must also work in practice. We assess how well it seals, protects the product and runs on the customer's existing packing equipment. We consider cost and practicality alongside each customer's sustainability goals.

► Improving our operations

We seek opportunities to increase renewable energy use and reduce energy consumption through better processes and technology. Separating operational waste helps make recycling easier, while reusing materials where practical helps reduce waste.

► Supporting our customers

Our technical team draws on an extensive library of film structures and material to recommend suitable options. We work with customers to understand their priorities, whether these focus on recycled content, plastic waste or carbon footprint, and review new materials as options develop.

OUR SUPPLY CHAIN AND OPERATIONS

Responsible sourcing and manufacturing

Our Sustainability approach extends beyond packaging design. We consider where our materials come from, how they are made and how we use resources throughout production.

► Responsible sourcing

We consider environmental, social and ethical practices when selecting suppliers, alongside material quality, reliability and performance. This includes how suppliers manage their operations and their employment practices.

► Local supply where practical

We consider local raw material suppliers where suitable to reduce transport distances and support Australian businesses. Material suitability, availability and the needs of each customer remain part of our sourcing decisions.

► Smarter manufacturing

We look for ways to improve our processes and equipment so we can reduce avoidable material waste and use energy more efficiently. We also seek opportunities to separate production waste for recycling and reuse material where practical.

WORKING WITH CUSTOMERS

Our team can review an existing pack or discuss a new specification to identify opportunities in material efficiency, recycled content and recyclable design that suit the product and its market.
